Bilateral Meetings

- Tuesday (09:00 am - 01:30 pm)

Description

PriGen was set up in 2003 by a group of researchers with expertise in the field of pharmaceutical biotechnology. The company carries out research and development activities in different areas, with particular attention to the the dermal-cosmetic field (cosmeceuticals). The experience gained by PriGen scientists in the field of biomedical research has enabled them to develop and patent an innovative technology: **Glycrosomal Technology**.

Through the use of this technology our scientists are able to develop topical formulations capable of:

- enhancing skin permeation of the active ingredients
- protecting the active ingredient inside the formulation
- eliminating or reducing the use of surfactants and oily substances.

Recent studies have shown that the use of this technology boosts the action of active ingredients more than threefold compared to normal formulations. Source: [Int J Pharm 455 \(2013\) 66-74](#)

Glycrosomal Technology was developed in the PriGen laboratories, and its benefits studied and applied in both the skin care and biomedical fields. Based on this innovative technology, PriGen has developed, in the skin care area, essential, non-aggressive formulations with high concentrations of hyaluronic acid, capable of providing the skin with the correct daily dose of active substances, in the absence of potential allergens.

Our formulations have been designed to ensure the greatest cosmetic efficacy without causing allergic reactions. All our products are characterized by an absence of allergy-inducing ingredients such as colorants, parabens, surfactants, nickel, PEG or other chemical additives. **SUITABLE FOR THE MOST SENSITIVE SKINS.**

Our mission is to **prevent** and **repair** the signs of aging, supporting and improving skin health by developing **essential** and **non-aggressive formulations**.
